Agentlens.

Reliability layer for production AI apps

Agentlens

Problem Statement

PROBLEM 1

AI providers fail silently. Rate limits, latency spikes, and outages hit without warning.

PROBLEM 2

Developers find out only after users complain. Existing tools show logs after the fact but don't prevent failures from reaching users.

PROBLEM 3

Teams waste hours debugging what went wrong instead of preventing it.

Agentlens

Solution.

Solution 01

Catches the ai provider failing even before your customer does

Solution 02

proactively checks provider health and automatically routes failed requests to fallback providers.

Solution 03

One-line install. Real-time visibility into failures, costs, and routing decisions. Explainable decisions, not black-box failover

How It Works.

01 **Step 1:**

Developer installs SDK

SDK instruments all AI requests

02 **Step 2:**

Proactive health checks run continuously

03 **Step 3:**

Failed requests routed to fallback automatically

04 **Step 4:**

Dashboard shows why each decision happened

Agentlens

Market.

Every team using multiple AI providers hits this problem. Langfuse, Helicone, Portkey, LiteLLM exist but focus on post-failure logging or routing configuration. The gap is proactive reliability: detecting degradation before users report it and recovering safely. Target: engineering teams at AI-first startups and SaaS companies using 2+ providers.

Use of Funds

- Complete automatic failover routing engine, expand provider coverage beyond current 8 providers, build production-grade onboarding flow, and ship proactive health-check infrastructure. This gets AgentLens from "records failures" to "prevents failures from reaching users."
- Onboard first 10-15 design partners from AI-first startups and SaaS companies using 2+ providers. Validate pricing hypothesis ($20/month base + usage tiers) and collect real incident data to prove the proactive reliability value prop.
- Cloud hosting, monitoring, uptime guarantees, and operational costs for running a production reliability service that teams can trust with their AI traffic.
